

Introduction

The client-side functionality of the application is built using React and Ionic, while server-side functions like authentication and data storage are managed by Firebase services (Authentication and Firestore). The client and server interact regarding CRUD operations on ToDo items and authentication tasks.

Features

User Authentication:

- **Sign Up:** Users can register for an account by providing their name, email, and password.
- **Login:** Users can log in to their accounts using their email and password.
- **Logout:** Users can log out of their accounts.

Description of Your Works (Systems)

Login System

- Provides a login interface where users can input their email and password.
- Authenticates users using Firebase Authentication.
- Checks if the user exists in Firestore, and redirects to the home page upon successful login.

Sign-Up System

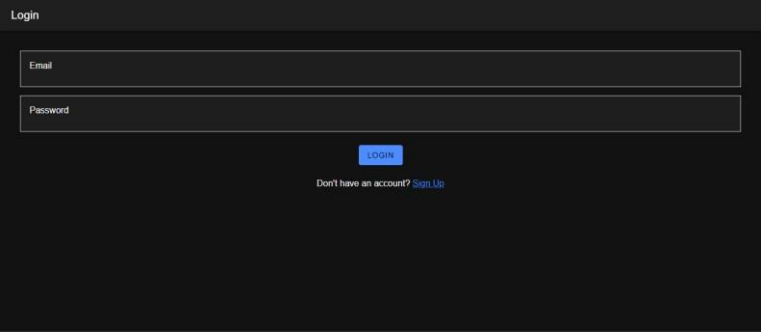

- Provides a sign-up interface where users can register by providing their name, email, and password.
- Validates user inputs and displays appropriate error messages.
- Stores user data in Firestore upon successful sign-up.

Conceptual Framework

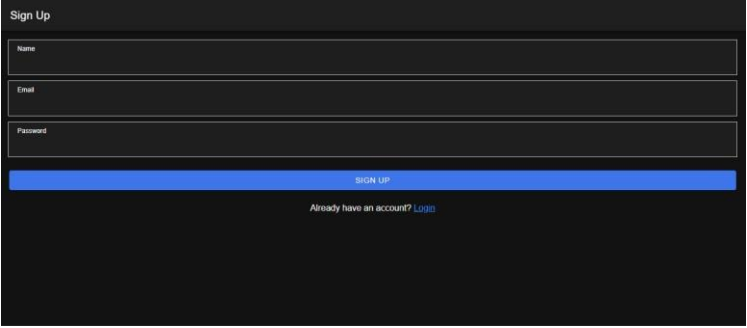

The program is designed using a client-server architecture. React and Ionic are used in the client-side development, and Firebase services (Authentication and Firestore) handle server-side functions like data storage and authentication. To perform CRUD operations on ToDo items and authentication tasks, the client and server communicate.
